

Think, Code, Play: Game Design with Scratch Coding

Sebastian Saldarriaga

Background

Biomedical Engineer
MA in Science Education

Current Role

Professional Development
Instructor at Geering Up, UBC

E-mail:
sebas.salda@ubc.ca

Who are we?

UBC Geering Up Engineering Outreach

Promoting diversity in STEAM, helping students discover they can do STEAM!

Programs:

- Events, Clubs, and Camps for Kids
- Workshops and Pro-D for Teachers
- Outreach

STEAM → Science, Technology, Engineering, Arts, Math

Emoji Algorithms

Here are two emoji programs. What's the scenario?

A chef mixes eggs, milk, and chocolate, bakes them, makes a cake, and celebrates.

If it's sunny, wear sunglasses and go to the beach.
If it's rainy, use an umbrella and read a book

Now it's your turn! Write a short 'emoji algorithm' (5-8 emojis) that describes your daily routine.

Example:

Wake up, drink coffee, take a shower, work on the computer, study, have dinner, go to bed, and sleep.

Introduction to Game- Based Learning

Game-Based Learning

Learning through the game itself

The game is the learning activity

Ex: Students use a boardgame to learn about photosynthesis

Engaging
Mechanics &
Feedback

Clear Learning
Goals

Narrative &
Characters

Social &
Collaborative
Features

Inquiry &
Problem
Solving

Emotional
Engagement

WHAT DO WE WANT STUDENTS TO LEARN?

Technical

- Computational thinking (sequences, conditionals, variables)

Creative

- Story design, visual and sound design, creative coding

Social

- Teamwork, peer feedback, design iteration

Metacognitive

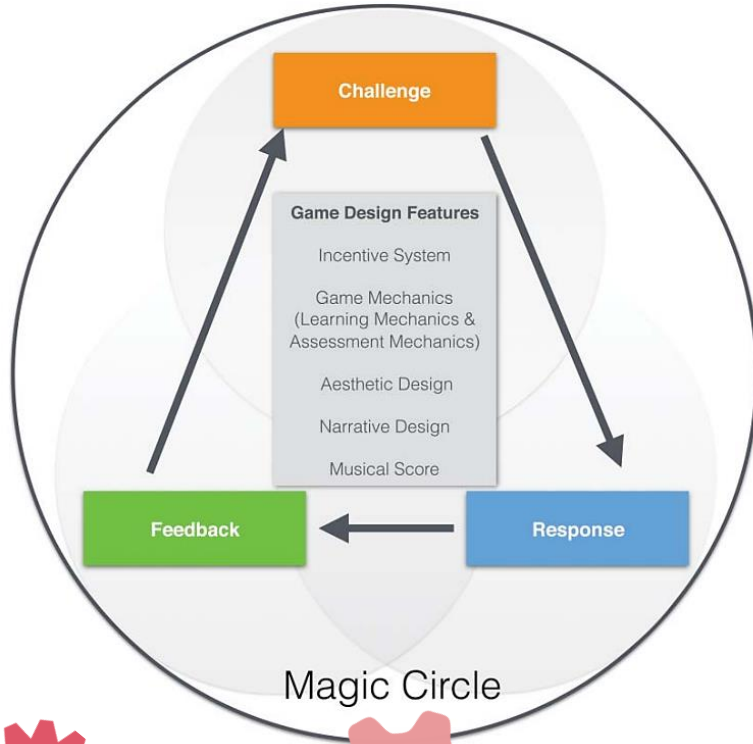

- Planning, testing, debugging, reflection

Conceptual

- Deepened understanding of curriculum content through meaningful game mechanics or story-driven interactions

Key elements

Challenge

Engages players and promotes learning.

Response

How players interact with the game content.

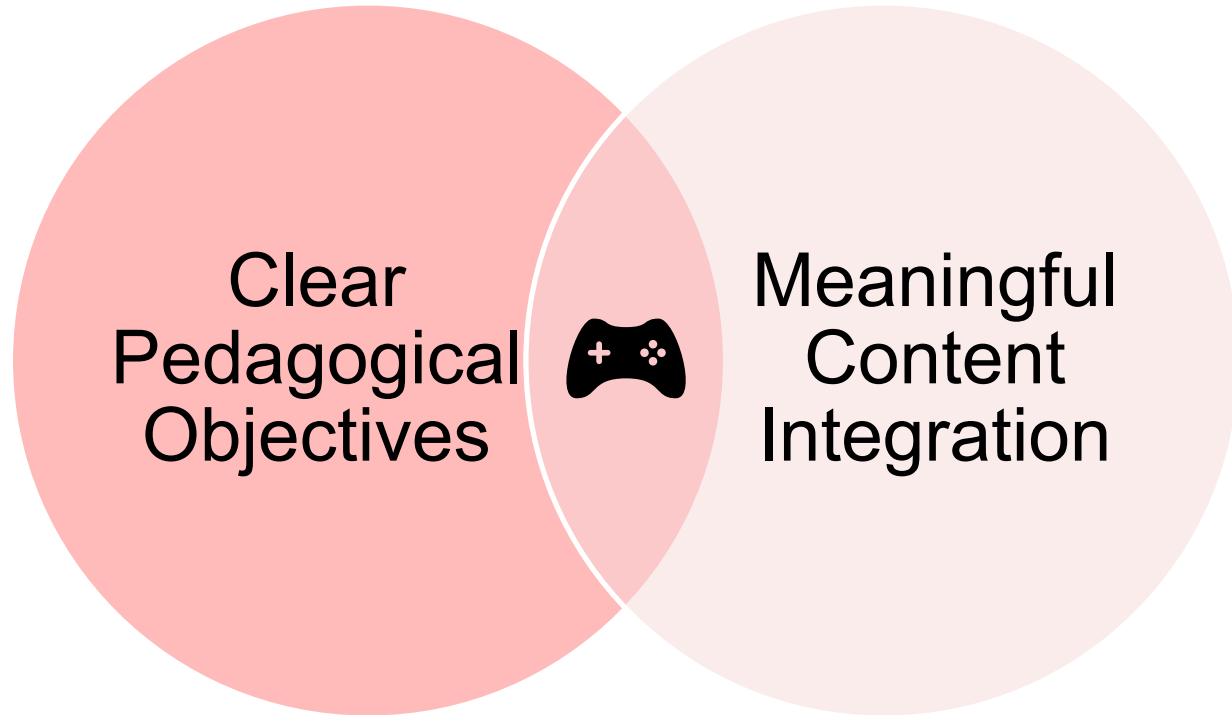

Feedback

Guides player progress and learning.

Game Design Elements

Narrative, mechanics, incentives, and aesthetics.

Learning First, Then Gameplay

Engagement does not always correlate with improved learning outcomes

(Lester et al., 2014; Li & Tsai, 2013; Plass et al., 2015)

Exploring Scratch as a Creative Tool

Coding vs Programming

Programming

- Solving problems with computers
- Giving computers instructions
- Everyone does this
- Runs code behind the scenes

Coding

- Using “code”
- Writing specific instructions
- Precise
- Flexible

Coding vs Programming

Programming

Less Technical

Coding

More Technical

Why Scratch?

Open access!

Visual block programming

Massive community

How it works?

Parts of a Flower on Scratch

The image shows four Scratch scripts for a flower simulation, each triggered by a "when clicked" event. The scripts are as follows:

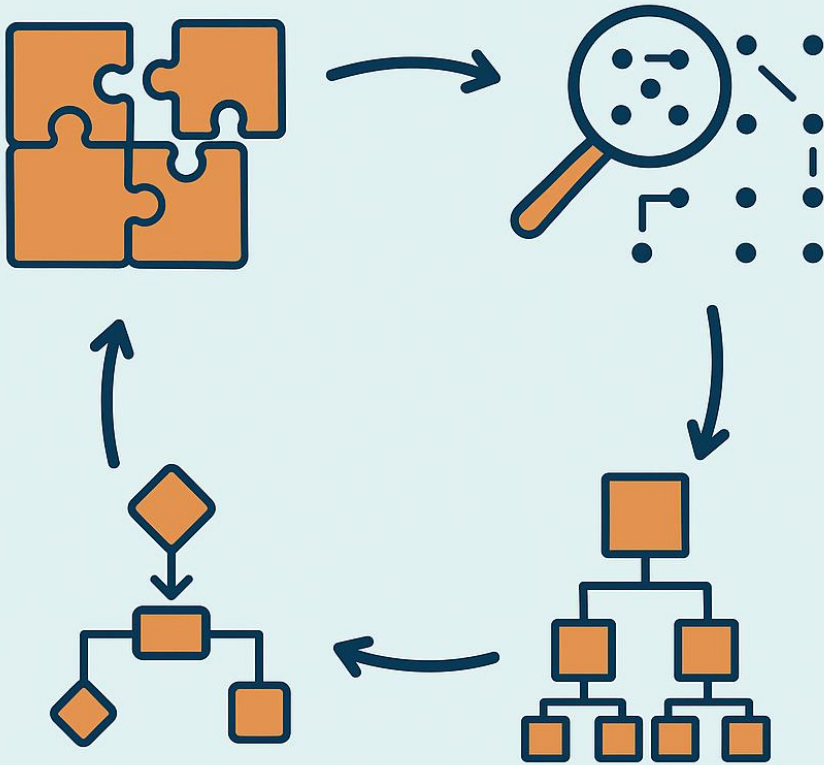

- Script 1 (Top Left):** A "forever" loop containing a "go to x: mouse x y: mouse y" block.
- Script 2 (Top Right):** A "forever" loop with an "if touching color [pink] ? then" block. Inside the if block, there are two "say" blocks: "say Petal for 2 seconds" and "say Attracts insects and other pollinators for 2 seconds".
- Script 3 (Middle Left):** A "forever" loop with an "if touching color [green] ? then" block. Inside the if block, there are two "say" blocks: "say Sepals for 2 seconds" and "say Formerly protected the flower bud for 2 seconds".
- Script 4 (Bottom Right):** A "forever" loop with an "if touching color [orange] ? then" block. Inside the if block, there are two "say" blocks: "say Stigma for 2 seconds" and "say Traps pollen for 2 seconds".

There is also a fourth script (Bottom Left) that is partially visible, containing an "if touching color [red] ? then" block with two "say" blocks: "say Stamen for 2 seconds" and "say Provides support for 2 seconds".

Computational Thinking

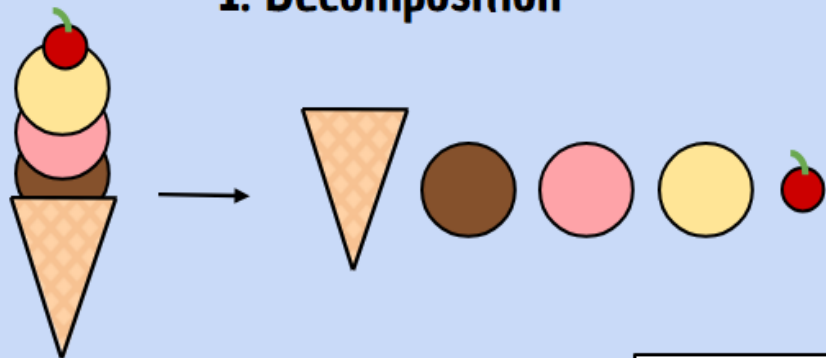

Computational thinking

A type of problem solving which involves expressing problems and solutions in terms which could be understood and executed by a computer

1. Decomposition

2. Pattern Recognition

Computational Thinking

3. Abstraction

4. Algorithm Design

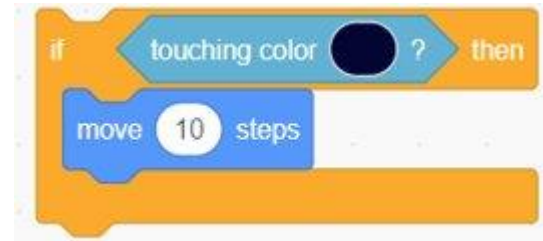

If → Then

IF you all pay attention, **THEN** you can go outside early for recess

IF you do your homework, **THEN** you can go play video games

IF (question/condition), **THEN** (result)

If → Then

IF you all pay attention

THEN you can go outside early for recess

ELSE you have to do math for longer!

IF you do your homework,

THEN you can go play video games

ELSE you are grounded

**Build your own Maze
game!**

SCRATCH

scratch.mit.edu/

Inquiry-Based Learning

What is Inquiry-Based Learning?

Student-centered approach

- Students explore questions, problems, or scenarios.

Focuses on **asking, investigating, and reflecting,** not just memorizing.

Builds skills:

- Critical thinking, creativity, collaboration, problem-solving.

Inquiry-Based Coding

Start with a single concept or tool

Lead group through a short tutorial using that concept/tool

Open-ended exploration

Encourage collaboration and sharing

- ✓ More accurately reflects real world coding
- ✓ Better at teaching all 4 aspects of computational thinking
- ✓ More flexible for ability levels

Example

Maze or logic games can become powerful tools to teach systems thinking, math, or strategy.

- <https://scratch.mit.edu/projects/1233389169>
- <https://scratch.mit.edu/projects/1192819990>

Prototyping Your Game

1. **Choose your scope** – Decide if your game will be one complete module or multiple connected levels.
2. **Use a GDD** – Follow the elements of a Game Design Document (story, characters, mechanics, learning goal).
3. **Sketch first** – On your large sheet or whiteboard, map out levels, interactions, and key scenes.
4. **Start building in Scratch** – Use sprites, backdrops, and code blocks to bring your concept to life.
5. **Test as you go** – Play your game frequently to spot bugs and refine mechanics.
6. **Document ideas** – Note changes, new ideas, and reflections for future iterations.

Curriculum Connections

Curriculum Alignment

ADST

Ideating: Generating and evaluating ideas for digital games

Prototyping: Developing working solutions (games) using code

Testing and Making: Iterating based on feedback

Sharing and Reflecting: Presenting projects and explaining decisions

Cross-Curricular

Science (e.g., ecosystems, environmental impact, body systems)

Social Studies (e.g., local/global issues, identity, Indigenous knowledge)

Language Arts (e.g., narrative structure, dialogue, storytelling)

Arts Education (e.g., character design, visual storytelling)

SEL (Social Emotional Learning) (e.g., empathy through story-driven games)

Curriculum Alignment

Computational Thinking

- Simple algorithms that reflect computational thinking
 - Sorting, searching, sequence, selection, repetition
 - Specific statements to complete simple tasks
- Visual Programming

Computers and Communications Devices

- Computer system architecture
- Strategies for identifying and troubleshooting simple software problems

The image features a white background with several stylized gears in various shades of red and pink. The gears are arranged in two clusters: one in the top-left corner and another in the top-right corner. The central text is in a bold, dark red font.

Assessment alternatives

Formative Assessment

Formative Assessment can focus on the process, not just the final game:

What to Assess?

Story Planning: character, setting, problem, message

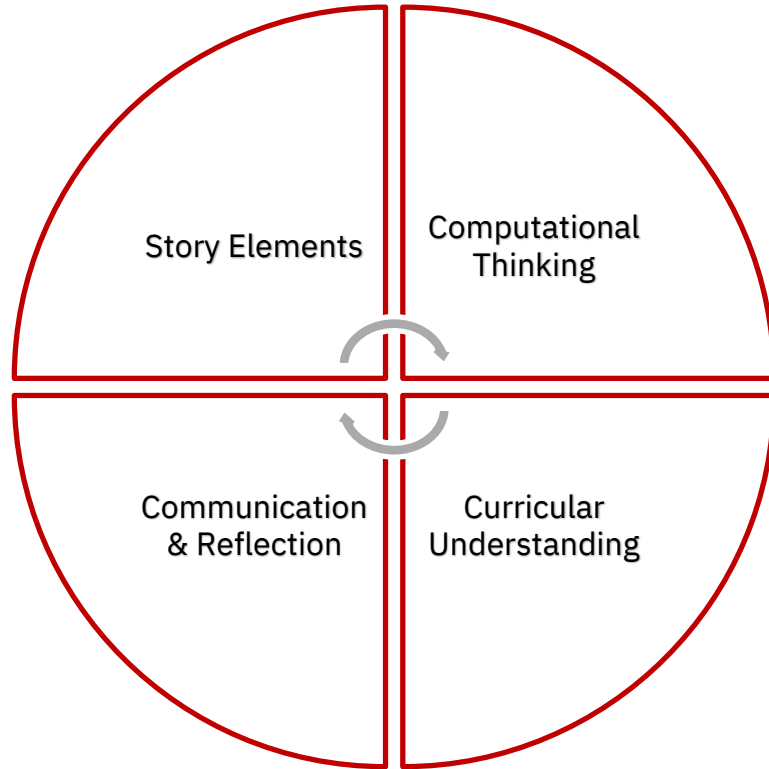

Programming Thinking: use of loops, conditionals, events

Curricular Understanding: connection between game content and subject matter

Collaboration & Communication: group decision-making and peer feedback

Focus on process and creativity, not technical perfection.

The image features several stylized gears of various sizes and colors (dark red, light red, and white) arranged in the top-left and top-right corners, creating a decorative border. The gears are interconnected, symbolizing mechanics, engineering, or interconnected systems.

Beyond Coding: A Creative Alternative for Project-Based Learning

Learning Scratch can be used not just in tech classes, but also as an alternative format for student projects in Science, Social Studies, Language Arts, and more.

A creative, multimodal way for students to show understanding

Combines storytelling, design, and interactivity

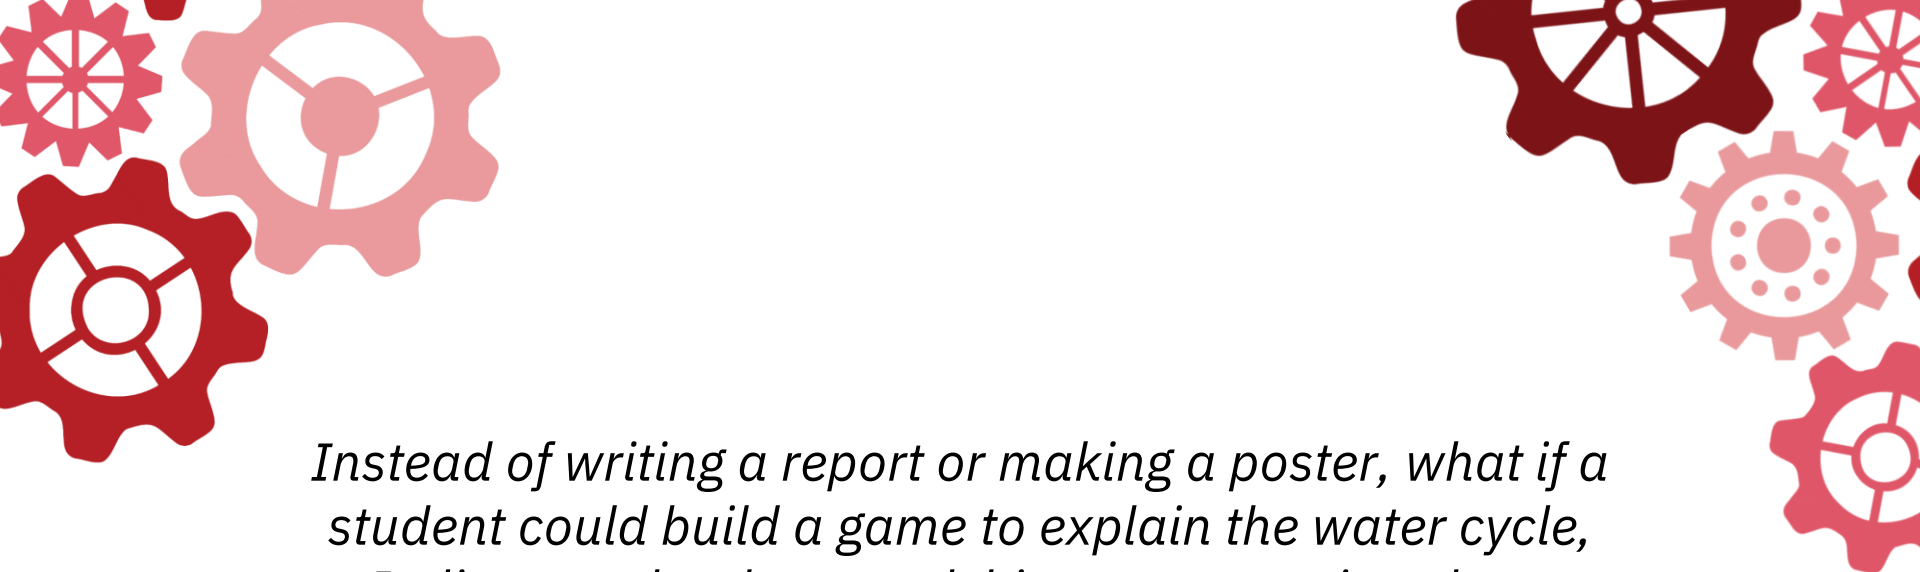

Teachers can use it to:

Highlight student voice and
creativity

Support project-based learning

Deepen engagement with
curricular content

The image features several stylized gears in various shades of red and pink, arranged in the corners of the page. The gears are of different sizes and designs, some with spokes and some with solid centers. The text is centered in the middle of the page.

Instead of writing a report or making a poster, what if a student could build a game to explain the water cycle, Indigenous land stewardship, or a narrative about empathy?

Extra Resources

Final Discussion

- What will you take away from today?
- Do you have any questions that are still unanswered? Or maybe new questions?

Liked this workshop?

Request a FREE Pro-D Workshop for your school:

pro-d.geeringup@ubc.ca

We cover topics such as ChatGPT, Engineering Design Challenges, coding in the classroom and more!

Other Resources:

- <https://pro-d.geeringup.ca> : STEM Lesson Plans, Online Courses, information about future Pro-D events, tutorials on online teaching tools
- 1:1 Support - any pinch points when trying to incorporate EDC in classrooms? Give us a call and we would be happy to brainstorm some solutions

In-Classroom Workshops

Led by two Geering Up instructors, workshops consist of hands-on STE(A)M activities covering BC curricular competencies and content.

Cost (1-1.5hrs)

1 workshop: \$195

3 workshops (on same day): \$175

6+ workshops: \$155

*financial support available.

Dates: January – April

Feb. 13, 2026, Pro-D @ UBC

Mathematical Masterpieces:

Exploring Math Concepts Through Art

This interactive workshop will explore hands-on projects that turn learning math into a work of art. You'll leave energized and equipped to help your students see the math hiding in the art around them.

Aimed for educators of grades 3-7.
